

## Appendix 16

### Figure R—Map of Russian Gulch Treatment Configuration

Figure R corresponds to Mitigation 11, Section VII, page 13. This Mitigation Measure contains approximately 2,000 acres within the Russian Gulch that have been designated as a research/demonstration area for the specific intention to accelerate the recruitment of old growth quality forest conditions. The development of large trees with suitable canopy closure and other habitat features, along with appropriate silvicultural prescriptions, have been designed to promote and increase future marbled murrelet habitat. This designated area shares a border with Woodlands Special Treatment area near Road 408, as depicted in Figure R, which serves to create a potential future flyway consisting of contiguous late-seral habitat.
